ASPECTS ARROW INTRODUCTION

Aspects Arrow is a report that interprets the aspects or angular configurations between solar system components at the time of your birth. Why would the angular relations between solar system components have anything to do with you? It is because you have an inner self that is orders of magnitude larger than your physical body. Your inner self is the solar system as it existed when you became an independent person. The Sun, Moon, planets, and nodal intersections between important celestial planes make up the components that form aspects to each other in your natal chart. There are zodiacal aspects and there are declination aspects. Zodiacal aspects are when the angle between two solar system components measured along the Earth's ecliptic is close in your natal chart to particular aspects, from the 0-degree conjunction aspect to the 180-degree opposition aspect. Declination aspects are formed when solar system components are either parallel or contraparallel to each other in angular distance north or south of the Earth's celestial equator.

In the charts of men, the Sun represents the base or core self. In the charts of women, the Moon represents the base or core self. We know this because when the Sun and Moon aspect each other in a person's chart, men have their nurturing qualities heightened by the Moon and women have their assertive qualities heightened by the Sun. Because of these differences, it is difficult to make unisex generalizations for Sun-Moon aspects that are accurate for both men and women. There are other gender differences in how aspects manifest, but this fact alone means that one should delineate aspects differently based on whether the person was born male or female.

These interpretations were made more accurate by a 3,500-page statistical table arranging 111 vocational and personal chart collection categories by frequency of occurrence for each aspect. The astrological frequency of many categories are different for males and females. Almost all collections consist of charts with known birth times, where the smallest category file is the Wealthy_f collection of 145 charts and the

AstroIDeluxe Chart Interpretation for Lois Rodden

largest is the Life_80s_m collection of 4,506 charts. There are two collections of untimed charts for noted lawyers, where the collection for males has 4,682 charts and for females 510. The average number of charts per collection is 873. When trying to figure out what an aspect is all about, the most frequent and least frequent categories for the aspect provide a significant starting point. If a collection has a lot of charts, and it appears near the top or the bottom of the frequency list for an aspect, then that is more statistically significant than is the relative position of a small chart collection. The small and large collections are, however, consistent - for example the smaller collection of 335 Disciplined charts is first for Saturn conjunct BlackMoon while the larger collections of 1,619 male Scientists is seventh and 3,438 Military is tenth, which are all much more frequent than being rare for that aspect at the one hundred and eleventh place. You will find references to these categories in this report's interpretations. Reliance upon big data statistics is new for astrology, but the statistics were still analyzed by human intelligence as opposed to artificial intelligence.

An observation that dates back to work on the minor square aspects (45-degree and 135-degree) is that aspects that are closer to 0 correspond to more youthful attitudes and aspects that are closer to 180 correspond to more mature attitudes. You can think of the 30-degree semi-sextile aspect as conferring the mental maturity of a 15-year-old and think of the 150-degree inconjunct aspect as conferring the mental maturity of a 75-year-old. This is just an observation that helps to explain why aspects manifest in the way that they do. This report is not based on theory, but on looking to see what characteristics and behaviors particular people who share the same aspect have in common, combined with the relative category frequencies seen for chart collections.
